lar, respiratory, digestive, excretory, or nervous system function. However, administration of cystamine did lead to complaints of lethargy and brief unpleasant sensations in the epigastrium in 10% of the cases. After administration of the drug some increase in sensitivity to motion sickness and to the effect of high temperatures was noted among subjects.

TITLE: Effect of radioprotective drugs on the functional condition of the human organism [Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24-27 May 1966]

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 282-283

TOPIC TAGS: radiation protection, space pharmacology, cosmic radiation biologic effect, human physiology, space medicine, motion sickness

ABSTRACT:

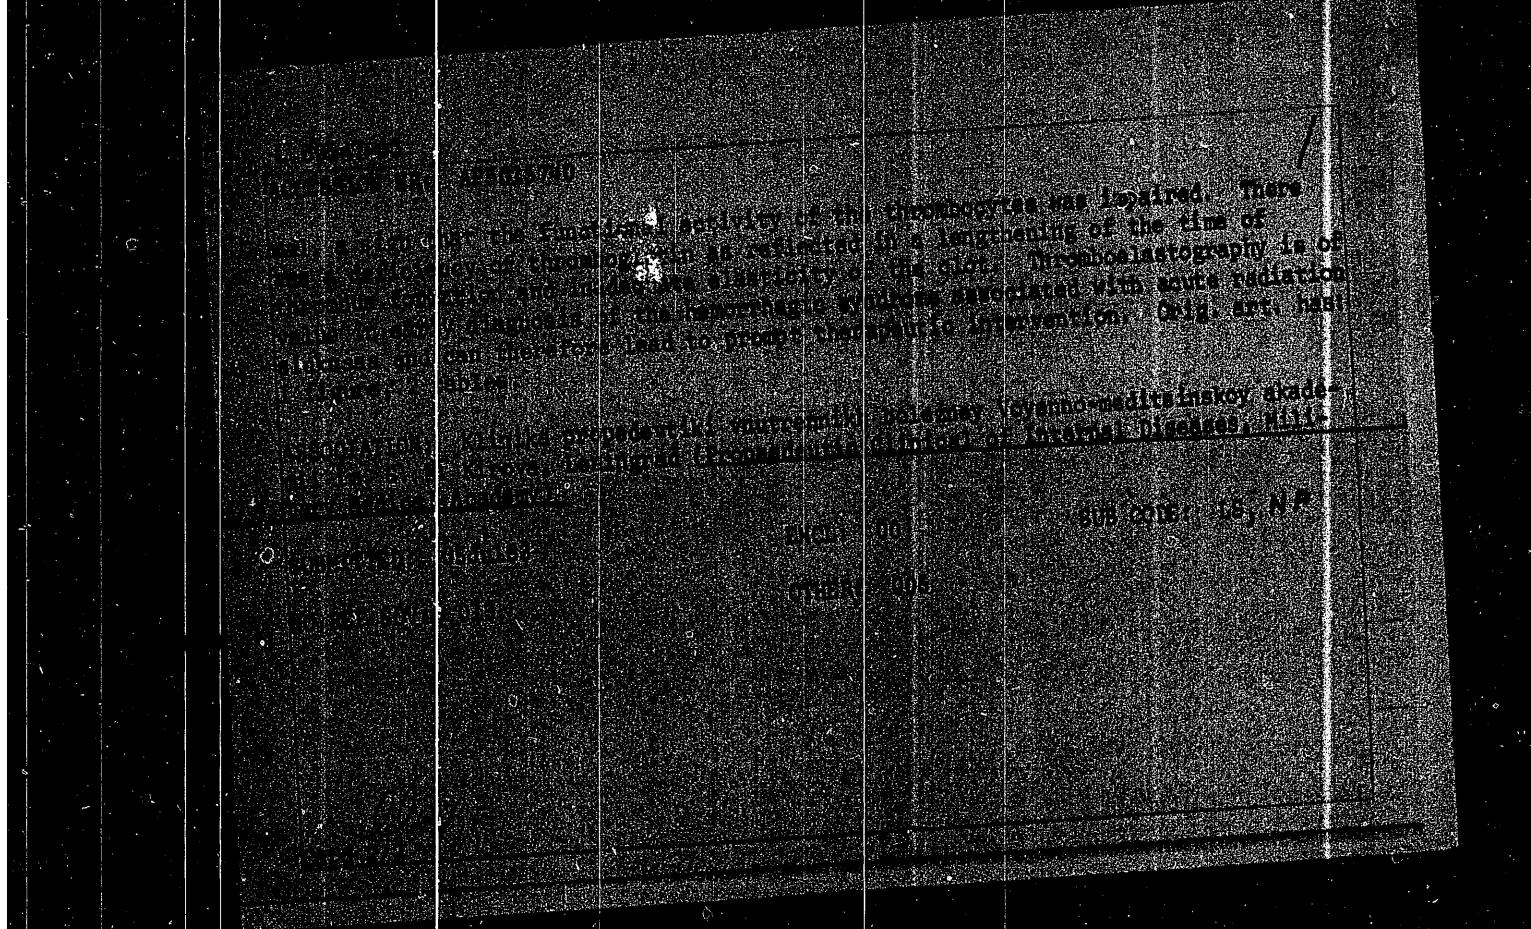

The effect of cystamine on the functional condition of the human organism was studied (on the basis of the hypothesis of A. V. Lebedinskiy). Five hundred healthy volunteers were used. The maximum permissible dose of cystamine was established as a dose of 1.2 [units not given] per single application, or 0.8 units every 6 hr for 24 hr, or 0.6-0.8 units once a day for a month. Administration of cystamine in the doses indicated did not cause any significant changes in work capacity, hematopoiesis, or in cardiovascular system. Card 1/2

showed a maximum between 4 and 8 hours of irradiation. These data suggest that cystamine either strengthens the regenerative processes to varying degrees or at different rates in the different tissues and organs. Experiments with S-35-cystamine showed that it accumulates primarily in the radiosensitive organs, particularly in the intestines and hematopoietic system (bone marrow and spleen). Injection of cystamine (60 mg/kg i.v.) 10-15 minutes before irradiation of dogs (500 r) decreased the extent and duration of leukopenia as compared to controls. Orig. art. has: 6 figures.

ABSTRACT: Experiments on mice exposed to various doses of x-radiation at a constant intensity of 30 r/minute showed that cystamine (150mg/kg i.p. 10-15 minutes prior to irradiation) increases the survival of mice, enlarging the LD<sub>50</sub>/30 by 300 r. The maximal effect was obtained at approximately 600 r, which is between the LD<sub>50</sub> and LD<sub>100</sub>. Analogous results were obtained with gamma irradiation at a constant dose of 900 r but various intensities. The protective effect of cystamine (400mg/kg p.o. 30 minutes before irradiation)

the determination of the current-carriers. The results of investigation of the process in the case of the existence of a movable injection region are shown as well as also of an electric field. In particular the possibility is found to "compensate" the asymmetry-effect by the electric field. The existence of such a compensation can be used for the determination of mobility by means of the "zero" method. First, the theory of the problem, the experimental system, and then results are dealt with. The scheme differs from that of Adam only by the possibility of forming and measuring a field in the sample, as well as by the utilization of some special types of development. In the case of the measuring method for mobility the so called "lambda-development" was used (the developed signal is shaped like the Greek

ABSTRACT: In their work the authors used Khristoforov coal dried  
to 14% residual moisture and ground to 0-1 mm. By  
extraction with dichloroethane in a large laboratory-  
scale apparatus (Ref 5) batches with nominal bitumen  
contents of 11, 6.8, 3.25 and 0% were prepared. From  
each batch ten 120-g briquettes were made, three of  
which were used for mechanical and seven for heat-  
resistance tests. For briquetting the authors used a  
60-tonne press giving a briquetting pressure of  
1500 kg/cm<sup>2</sup>. For hot-strength tests a procedure  
described by Werner in 1935 (Ref 8) was used. In this  
a briquette (Fig 1) is burnt under load under carefully  
controlled conditions, (with observation) (Fig 2).  
The heat-resisting index being the time from the start  
Card 1/2 of combustion to briquette failure. The hot strength

Thermochemical Methods for Obtaining Briquettes and Coke Briquettes  
from Coals and Schists with Small Tendencies to Clinkering.

results of the first series of experiments. The influence of various technological parameters on the mechanical strength of the briquettes was investigated (i.e. the concentration of the tar substances in the vapour phase, the final temperature of plasticisation of the coal mass, of pressures during pressing etc - Figs. 2, 3 and Table 3). Coke briquettes were made from coal with small tendency to clinkering. The lay-out of an industrial plant for making these coal briquettes from coals and schists is described (Fig.4). For plasticising the coal masses before pressing the same volatile products obtained during the coking of briquettes were used, and in this way part of the heat of the direct coke gases could be used effectively. Table 6: physic & chemical properties of coke briquettes. The authors also give a cost estimate for the process (Table 7). There are 7 Tables, 4 Figures and 5 Soviet References.

PERIODICAL:

ABSTRACT: A method for introducing binding substances in the vapour phase into the briquetting material and their subsequent condensation on the surface of the coal particles is discussed (Ref.1). This is achieved by plasticising the coal mass by treating the same before pressing with hot tar-containing gases. The vaporous tar substances are distributed evenly in the briquetting material, and the high-boiling fractions of coal tar interact physically and mechanically with the coal substances. Consumption of the binding substances can, therefore, be lowered, and lower pressures applied during the pressing of briquetting materials. A method and an apparatus for making briquettes under laboratory conditions are given (Fig.1). Table 1 shows the characteristics of the tested coals; Table 2

the author derives the energy balance formula

$$\frac{p_a \epsilon}{\epsilon - 1} = p_0 \eta_v k + \frac{\beta p_r}{\epsilon - 1} - \eta_v p_a (k - 1),$$

where  $k$  is the adiabatic index;  $\beta$  is a coefficient which takes into account the decrease in the internal energy of residual gases on their expansion from the pressure  $p_r$  to the pressure  $p_a$  during the initial period of the filling of the cylinder with the carbureted mixture. The coefficient  $\beta$  changes from 0.96 for full throttle to 0.80 for idling. For a specified  $\eta_v$  it is possible to determine  $p_a$  from this formula. A formula for the cylinder-filling temperature  $T_a$  is also derived. Orig. art. has: 2 figures.

TITLE: Features of the calculation of throttling regimes of the carburetor engine

SOURCE: AN GruzSSR. Soobshcheniya, v. 42, no. 3, 1966, 665-670

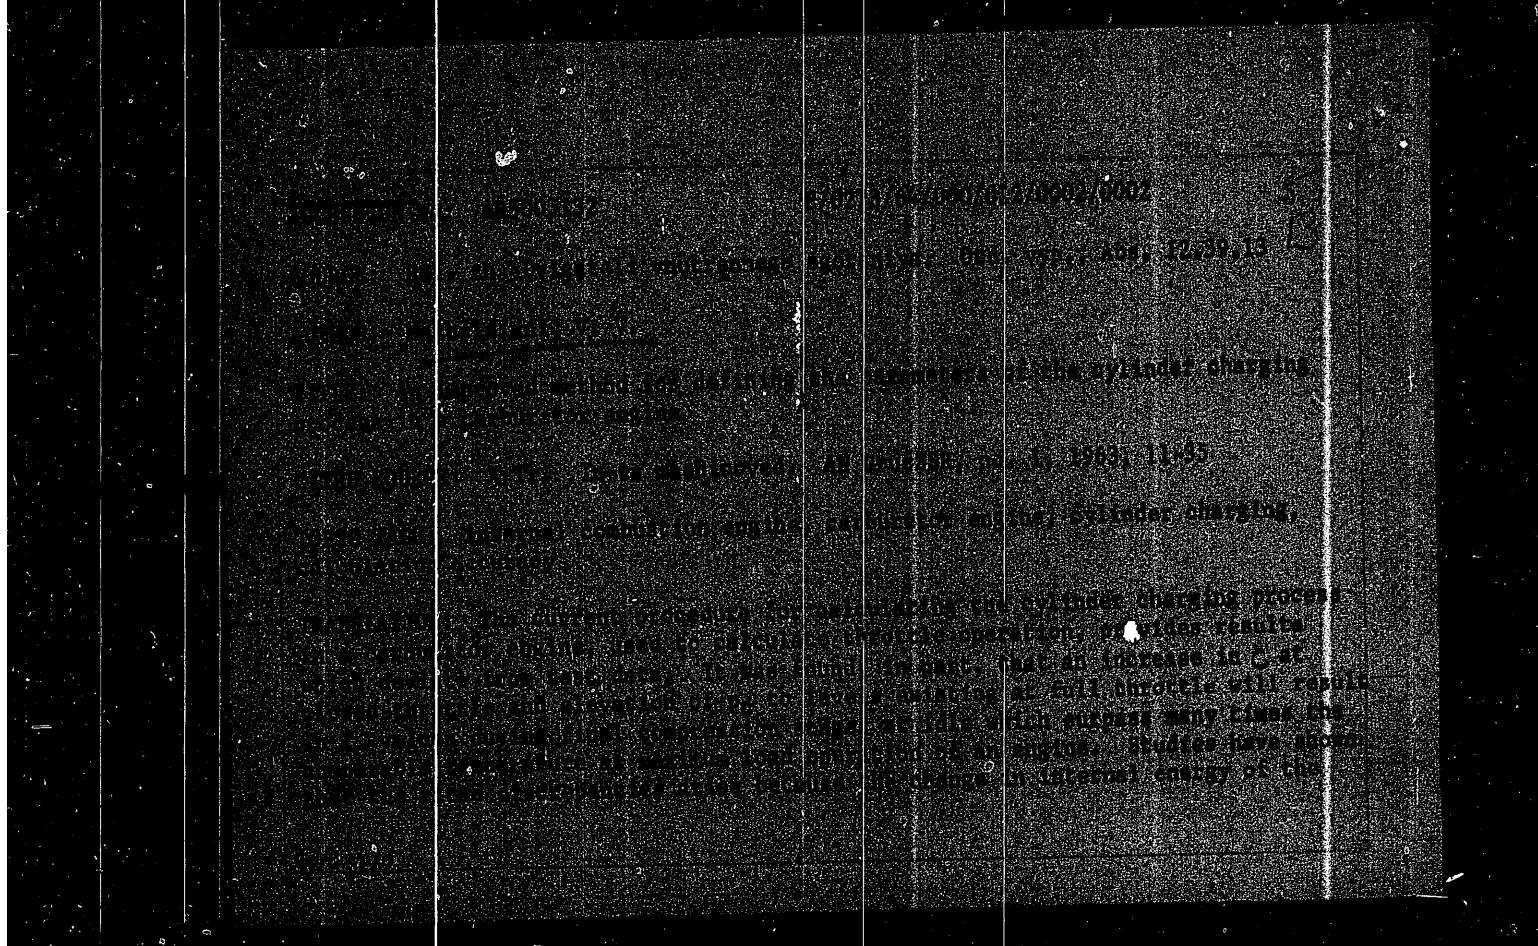

TOPIC TAGS: fuel carburetor, vehicle engine, ~~engine auxiliary equipment~~, temperature dependence, ~~vehicle engine fuel system~~, piston engine /ZIL-120 piston engine

ABSTRACT: This is a continuation of previous investigations (V. V. Makhaldiani, Osobennosti raboty avtotraktornykh dvigateley v vysokogornikh usloviyah, Tbilisi, 1957; Trudy Instituta mashinovedeniya, t. 1, 1963) with the difference that it deals with an experimental study of a ZIL-120 engine on a test rig equipped with thermometers for measuring the temperatures of the freshly carbureted fuel mixture  $t_c$  as well as the mixture at the inlet valve  $t_{i.v.}$ , i.e. prior to entry into the cylinder. Curves of these temperatures, plotted as a function of the extent of throttling, show that the temperature of the fuel mixture increases with decreasing cross sectional area of throttle (Fig. 1). At first glance, this may be unexpected

division for machine building took up work in this field in cooperation with experts from the Kutais Automotive Works. Amongst other special devices, the system of exhaust-braking which is already widely used in foreign countries, should be introduced. It consists in the fact that when closing the exhaust-pipe by means of a slide, the engine begins to work as a compressor in which case the kinetic energy of the running automobile is absorbed. 30 automobiles with a special system of exhaust-braking, as well as with a reinforced cooling-system should be manufactured in the current year. Test-trips in the high mountains should be carried out with these vehicles which are an improved type ZIL-150.

AUTHOR: Makhaldiani, V. V., Member, Academy of Sciences, Georgian SSR

TITLE: The Mountain Automobile (O gornom avtomobile)

PERIODICAL: Vestnik Akademii nauk SSSR, 1958, Nr 6,  
pp. 77 - 79 (USSR)

ABSTRACT: The work conditions of automobiles in mountainous regions are characterized by many peculiarities which exercise a detrimental influence and lead to a decrease in power, greater consumption of fuel, as well as to premature wear and to an increase in the transportation costs. Moreover, the driver's work becomes more complicated, which increases the danger of damages. Scientists from the Georgian SSR for the first time took up research works in this field in 1938. A division for machinebuilding which was charged with carrying out these works was established at the Institute of Metallurgy AS Georgian SSR. The Institute of Agriculture, as well as the Institute of Polytechnics are also carrying out research works in this field. On the basis of the carried out investigations, it was decided to organize the manufacturing of mountain automobiles in the Kuteis Automotive Works imeni G.K. Ordzhonikidze. In 1956, the collaborators of the

MAKEYEV, N.

Insti

Engineers B. Komarov, N. MAKEYEV and M. Belkina described 3 automatic devices designed and manufactured by the Standardization Bureau of the Min. of Machine Tool & Instrument Industry. One of them is used for checking dia of cathode cores of finger radiotubes, the other for counting watch jewels and the third for counting cathode cores. The capacity of the first device is 1,000 checked and packed cores pr. hr. The capacity of the counting devices is 12,000 to 15,000 items per hr.

TITLE: A sorption vacuum pump. Class 27, No. 187205

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 94

TOPIC TAGS: vacuum pump, sorption

ABSTRACT: This Author's Certificate introduces: 1. A sorption vacuum pump containing a getter substance evaporator located within the sorption surface which is cooled by a low temperature refrigerant. The pumping range is expanded by making the sorption surface in the form of a hollow coiled tube with gaps between the turns. This coil is located within the water-cooled jacket of the pump. 2. A modification of this pump with a heater inside the coil cavity to increase heating efficiency in outgassing the pump.

with high effective viscosity and maximum strength. About 2% acetone is an effective dispersing agent, imparting maximum stability to the bentonite-dimethylbenzylalkylammonium chloride system. The mixture is effectively homogenized on a disk grinding mill. Additives which may be incorporated in the bentonite lubricants include sodium nitrate as an anticorrosive, phenothiazine as an antioxidant and molybdenum disulfide as an antiwear agent. Bentonite lubricant VNII NP-226 showed better properties than lubricant YANZ-Z on an auto wheel testing unit GAZ-51. TITLE: Plastic lubricants based on aminated bentonite clays

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 2, 1964, 30-36

TOPIC TAGS: bentonite clay, lubricant, animated bentonite clay, hydrophobic property, oleophilic property, hydrophobizing agent, dimethylbenzylalkylammonium chloride, modified bentonite clay

ABSTRACT: The modification bentonite clays with high molecular organic amines to improve their hydrophobic and oleophilic properties was investigated. Of the native bentonite clays (Askansk, Gumbrinsk, Oglanlinsk, Gil'abinsk, and Kilsk-Krym), the Askansk is the most suitable for lubricants in view of its cation exchange capacity of about 100 mg. equiv./100 gm. of air-dried clay. Dimethylbenzylalkylammonium chlorides are better hydrophobizing agents than dimethyldialkylammonium chlorides in that they give products

Bentonite Lubricants as Substitutes for Lubricants of Solid Oil and Konstalin Type

15% of aminated clay (6 - 9% of clay + 4 - 6% of amine) does not exceed 1.1%. In spite of the low pH index (for some samples 4.3) the lubricants do not cause corrosion of steel plates. Lubricants with optimum viscosity are obtained from a clay suspension in which the mean size of the particles  $\leq$  0.2 mm. Changes in the optimum ratios between amines and clay deteriorates the quality of the lubricant.

iskusstv. zhidk. topliva, 1958, Nr 7, pp 378-389

ABSTRACT: The method and the technological system is described for the production of bentonite lubricants on the base of Askangel clay (Georgian SSR) which has been aminated by octadecylamine, and distyryldimethylammonium chloride and bromide; the industrial oil 20 served as oil base. The effect of the degree of dispersion of the clay in suspension, the quantity of amine used for precipitation and the pH of the medium on the effective viscosity of the lubricant were studied. In the samples which were prepared according to optimum prescriptions the effective viscosity was determined in the temperature range from -20°C to + 50°C (speed gradient  $D = 1,537 \text{ sec}^{-1}$ ). The syneresis of all samples containing
